

2600Hz Mobile

Product Overview

Seamlessly integrate 3G/4G mobile voice, SMS and data services with your existing KAZOO PBX offerings.

What is 2600Hz Mobile?

2600Hz Mobile is your business phone system, extended to your cellular phone. Imagine being able to pick your own device, instantly activate it and have it be seamlessly integrated amongst all of your business communications services.... 2600Hz Mobile makes this possible.

You can now integrate mobile, voice, data and SMS services with hosted KAZOO PBX services. 2600Hz Resellers can easily sell, activate and manage mobile phones through the 2600Hz Mobile Portal, allowing customers to have the freedom to make and receive calls from any device.

Key Benefits of 2600Hz Mobile

Add Revenue & Enhance Existing Service Offerings

By offering mobile services, service providers can add an additional \$50-\$100 per device in revenue without changing their existing fixed line set up. There's no software or equipment to install, each device only takes a few minutes to activate before you can start making calls and using data.

Offer New Service and Features

By providing a business mobile option, service providers are able to bundle services that modern day customers need. Competitors offer retail agent programs, which give you almost no control over the end user experience after the sale. These offerings satisfy the retail market, but cannot offer the deeper communications integration that differentiates 2600Hz Mobile. Since 2600Hz is integrated from the switch side, the rich call control and features you have come to expect with KAZOO are present right out of the box.

2600Hz Mobile Includes:

Services

- Mobile Voice
- SMS
- Data

Features

- Call Move (transferring calls between a user's devices)
- Extension Dialing
- In-Call Feature Key Commands
- Presence Indicators
- Call Recording (across all devices)

Broad Device Support

Now, both mobile and fixed line numbers can be shared across multiple devices, permitting you to take inbound calls from any device. PBX business telephone features are available natively on mobile devices, including:

- Smartphones
- Tablets
- Desk Phones
- Presence Indicators
- 4G LTE Hotspots

2600Hz Mobile supports a wide array of new and used CDMA mobile devices, including but not limited to:

- Apple iPhone 4 thru 7
- Samsung Galaxy 5 thru 7
- HTC M8/M9
- Google/Motorola Nexus

2600Hz Mobile vs Competitor Services

Set Your Own Price Plans

By offering mobile services, service providers can add an additional \$50-\$100 per device in revenue without changing their existing fixed line set up. There's no software or equipment to install, each device only takes a few minutes to activate before you can start making calls and using data.

Unparalleled Call Quality

By providing a business mobile option, service providers are able to bundle services that modern day customers need. Competitors offer retail agent programs, which give you almost no control over the end user experience after the sale. These offerings satisfy the retail market, but cannot offer the deeper communications integration that differentiates 2600Hz Mobile. Since 2600Hz is integrated from the switch side, the rich call control and features you have come to expect with KAZOO are present right out of the box.

Call Rate Advantage

Service providers are able to capitalize on 2600Hz's low international rates for calls that are placed over KAZOO's network.

Not Another VoIP Application

While most companies use an Over-the-Top (OTT) app that goes over the data part of the network, 2600Hz integrates directly with the carrier to ensure maximum call quality by going over the voice part of the network. Though no application is required to use 2600Hz mobile, third party VoIP & Mobile Device Management apps can be used alongside this service. End customers are able to use their business mobile devices as normal, while taking advantage of the additional KAZOO PBX functionality and features that make this product so valuable.

It's simple: no apps, no hassles. True Integration.
