

# Revolutionizing Business Communications

## What is KAZOO?

KAZOO is an enterprise grade softswitch built to provide advanced PBX, voice, data and messaging services to millions of users. 2600Hz offers three suites of KAZOO to support your business telecom needs. Once deployed, KAZOO's unique architecture scales with your business, and gives you the control to provide futuristic communications products, all while reducing labor and management costs.

## Key Benefits

- White labeling
- Advanced provisioning
- Geo-redundant with failover
- Bring your own carriers and devices
- Competitive business telephony features

## Which KAZOO Suite is Right for You?

### Hosted Platform

Our SaaS solution is ideal for resellers looking to manage devices, DIDs, trunks and more at the touch of a button, without any hardware or technical knowledge required.

Hosted Cloud is a turn-key office communications system that is fully redundant and supports multiple back end carriers, with automated failover across zones. This means as long as there's internet connectivity, your services will never be down.

### Private Cloud

Partners looking for a private, secure and fast system that allows for customization, should explore the Private Cloud suite. This product combines and optimizes renting server space with purchasing an advanced telecom solution.

Let 2600Hz manage the servers and uptime so you can focus on deploying quickly and reliably to your users.

### Global Infrastructure

Partners that are experts in managing their own infrastructure and are interested in enjoying complete control over their network should deploy KAZOO's clustered architecture inside their own data centers. Let 2600Hz install, monitor and support your cluster 24/7, so you can focus on the end users and not on uptime or cost.
